SmartWatch

THE SMARTWATCH INSPYRE SOLUTION

When the SmartWatch Inspyre by SmartMonitor detects repetitive shaking motion, it signals the user's device (iphone or Android phone) to send text and phone call alerts to whomever the SmartWatch Inspyre user designates, such as multiple family members, care providers or a 24/7 monitoring centre.

Within seconds, family members receive these alerts which include the date, time, location and duration of the event. SmartWatch Inspyre users can also summon help with the push of a button, anywhere, and detailed reports of each event can be securely accessed for later review with physicians.

- Receive Out Of Range Warnings

- Compatible with Samsung Galaxy phones running Android 4.3+, other Android 4.4+ phones, iPhone 5 or later with iOS 9
- Compatible with SmartWatch Samsung Gear Sport, Classic and Frontier Apple Watch Series 3 and above

How It Works

The SmartMonitor Inspyre app can be downloaded to your Android or Apple Smartphone and links via Bluetooth to your Samsung or Apple SmartWatch that is worn like any other watch but it's unique features help monitor your movement and detect any abnormal patterns in your movement such as those experienced in an epileptic seizure. In the event that abnormal motion is detected or the help button being pressed the watch triggers the accompanying smartphone app to send SOS alerts out to one or several defined SOS contacts.

Over this connection your watch sends information to the smartphone that is then sent up to our cloud. In the event of an emergency the SmartWatch will tell the app to send your alerts to the nominated contacts along with your location.

If the watch is taken out of range of the accompanying smartphone then it will re-connect as soon as you bring it back in range. But then who doesn't carry their mobile close these days anyway?!

Suitable for adults and children for day and night time monitoring.

Available as a package or subscription only.

Why SmartWatch?

The SmartWatch has been thoroughly evaluated in clinical studies conducted at several leading medical institutions, including Stanford and University of California, San Francisco (UCSF). These studies have validated the ability of the SmartWatch to detect and alert upon repetitive shaking motion similar to those caused by convulsive seizures in both adults and children.

In addition to clinical studies, Smart Monitor has conducted hundreds of in-home tests with both adult and child users to validate the usability of the SmartWatch during day-to-day activities at home, in school, at the office and elsewhere. The SmartWatch has been extremely well received by people with epilepsy and their families and the medical community.

The SmartWatch with SmartMonitor app has been available through Epilepsy Solutions in the UK for over four years and we are able to offer UK telephone and email support, Monday – Friday 9.00a.m to 5.00p.m.

INDEPENDENCE

I am beyond grateful for the Smart Monitor and the peace of mind it will afford me. My son is an active, independent 15 year old and this watch will allow to regain a little of the independence he enjoyed before the seizures began. Thank you from the bottom of my heart.

- JENNIFER A

SAFETY

The Smart Monitor has been amazing. It alerted us to a myoclonic just in time. We were able to get my daughter quickly, as she goes into respiratory distress often. We were also able to show the doctors the data of what was recorded, and she is going back into hospital to try to get better control on her meds. The Smart Monitor is a life saver!

- TRACY W

PEACE OF MIND

The Smart Monitor has definitely increased my peace of mind. My daughter lives on her own, and I would constantly worry about her safety. While wearing the Smart Monitor she experienced a seizure on a different floor than her roommate was instantly alerted and was there to help immediately. Knowing she can receive help right away makes her more confident and allows me to worry less.

- ROBERT B
